Prepared for the 2022 Annual Meeting of the Texas Academy of Sciences

GALVESTON BAY
DOLPHIN RESEARCH PROGRAM

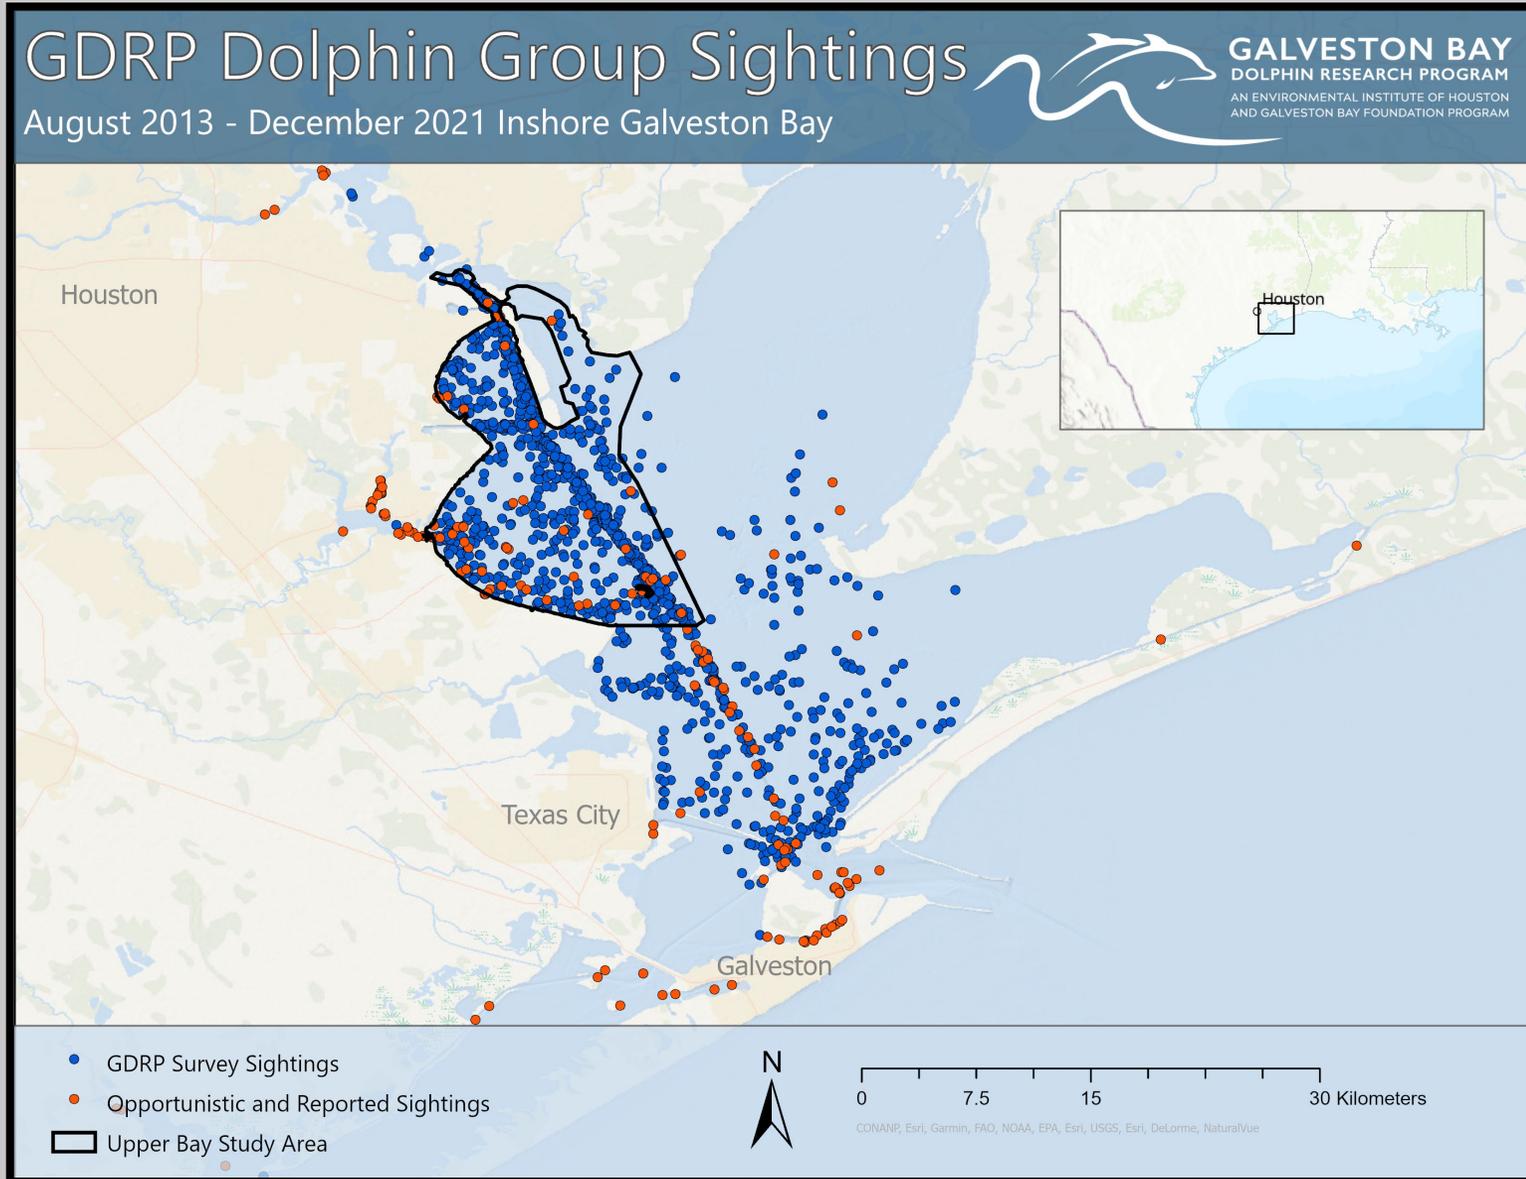

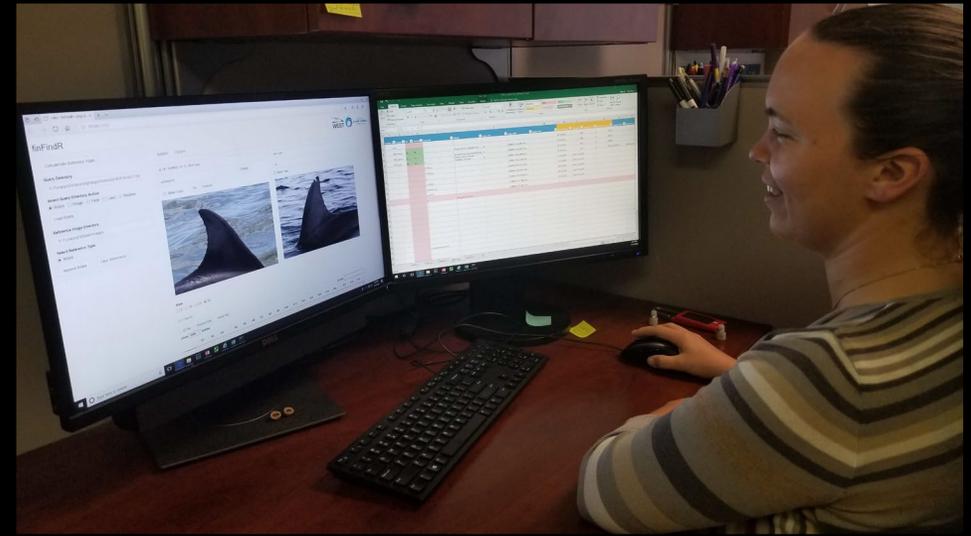

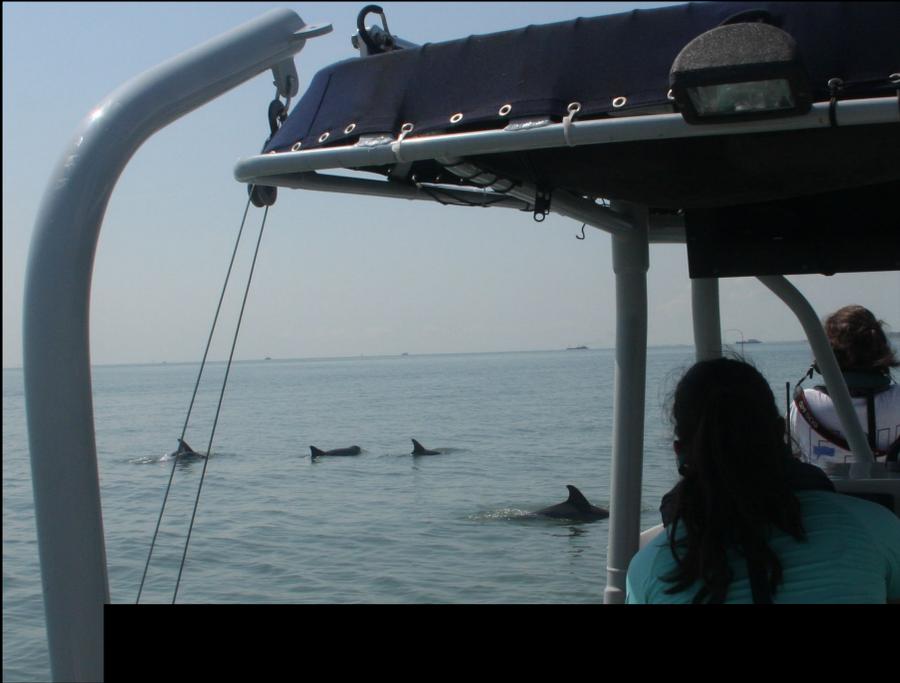

Activities conducted under NOAA Fisheries Scientific Research Permit #23203

Galveston Bay Dolphin Research Program (GDRP)

- Long-term monitoring to study the ecology, behavior and health of the bottlenose dolphin population
- Boat-based surveys since 2013 (standardized monthly since 2016)
- Focus on Upper Galveston Bay
- Photo-Identification
- Catalog: 942+ distinct individuals; ~200 “residents”

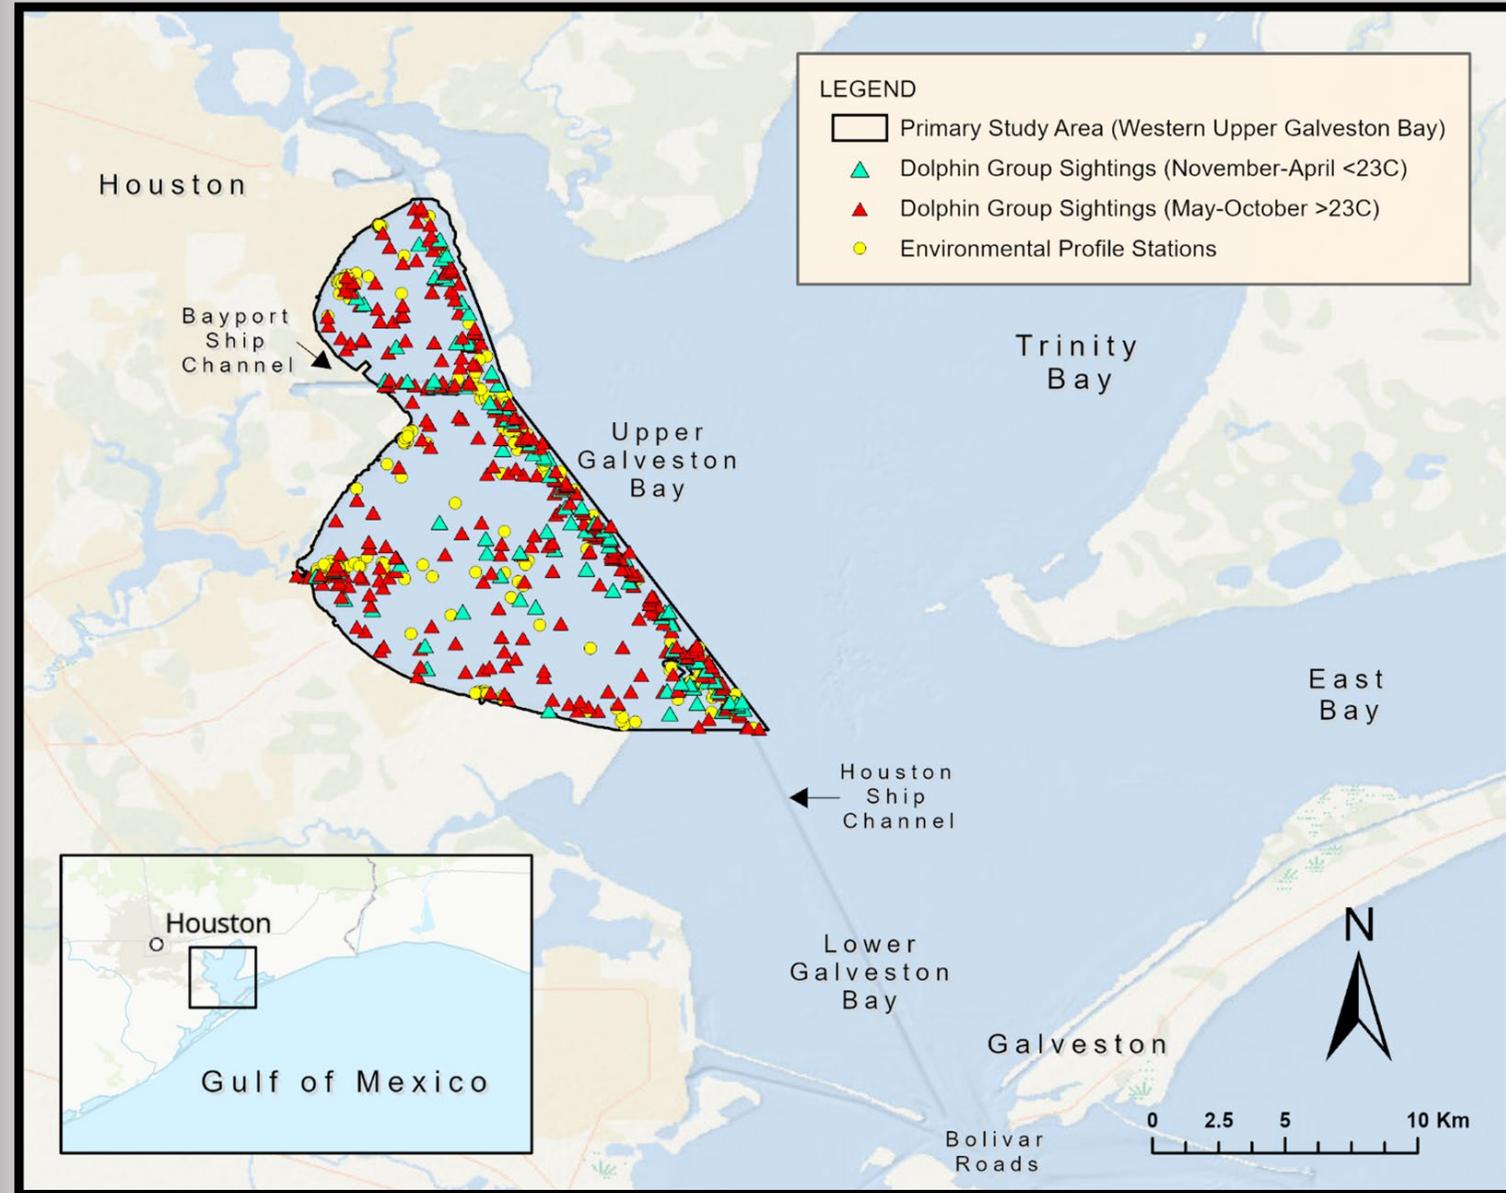

Encounter Rates

d/km = # dolphins sighted per linear km surveyed

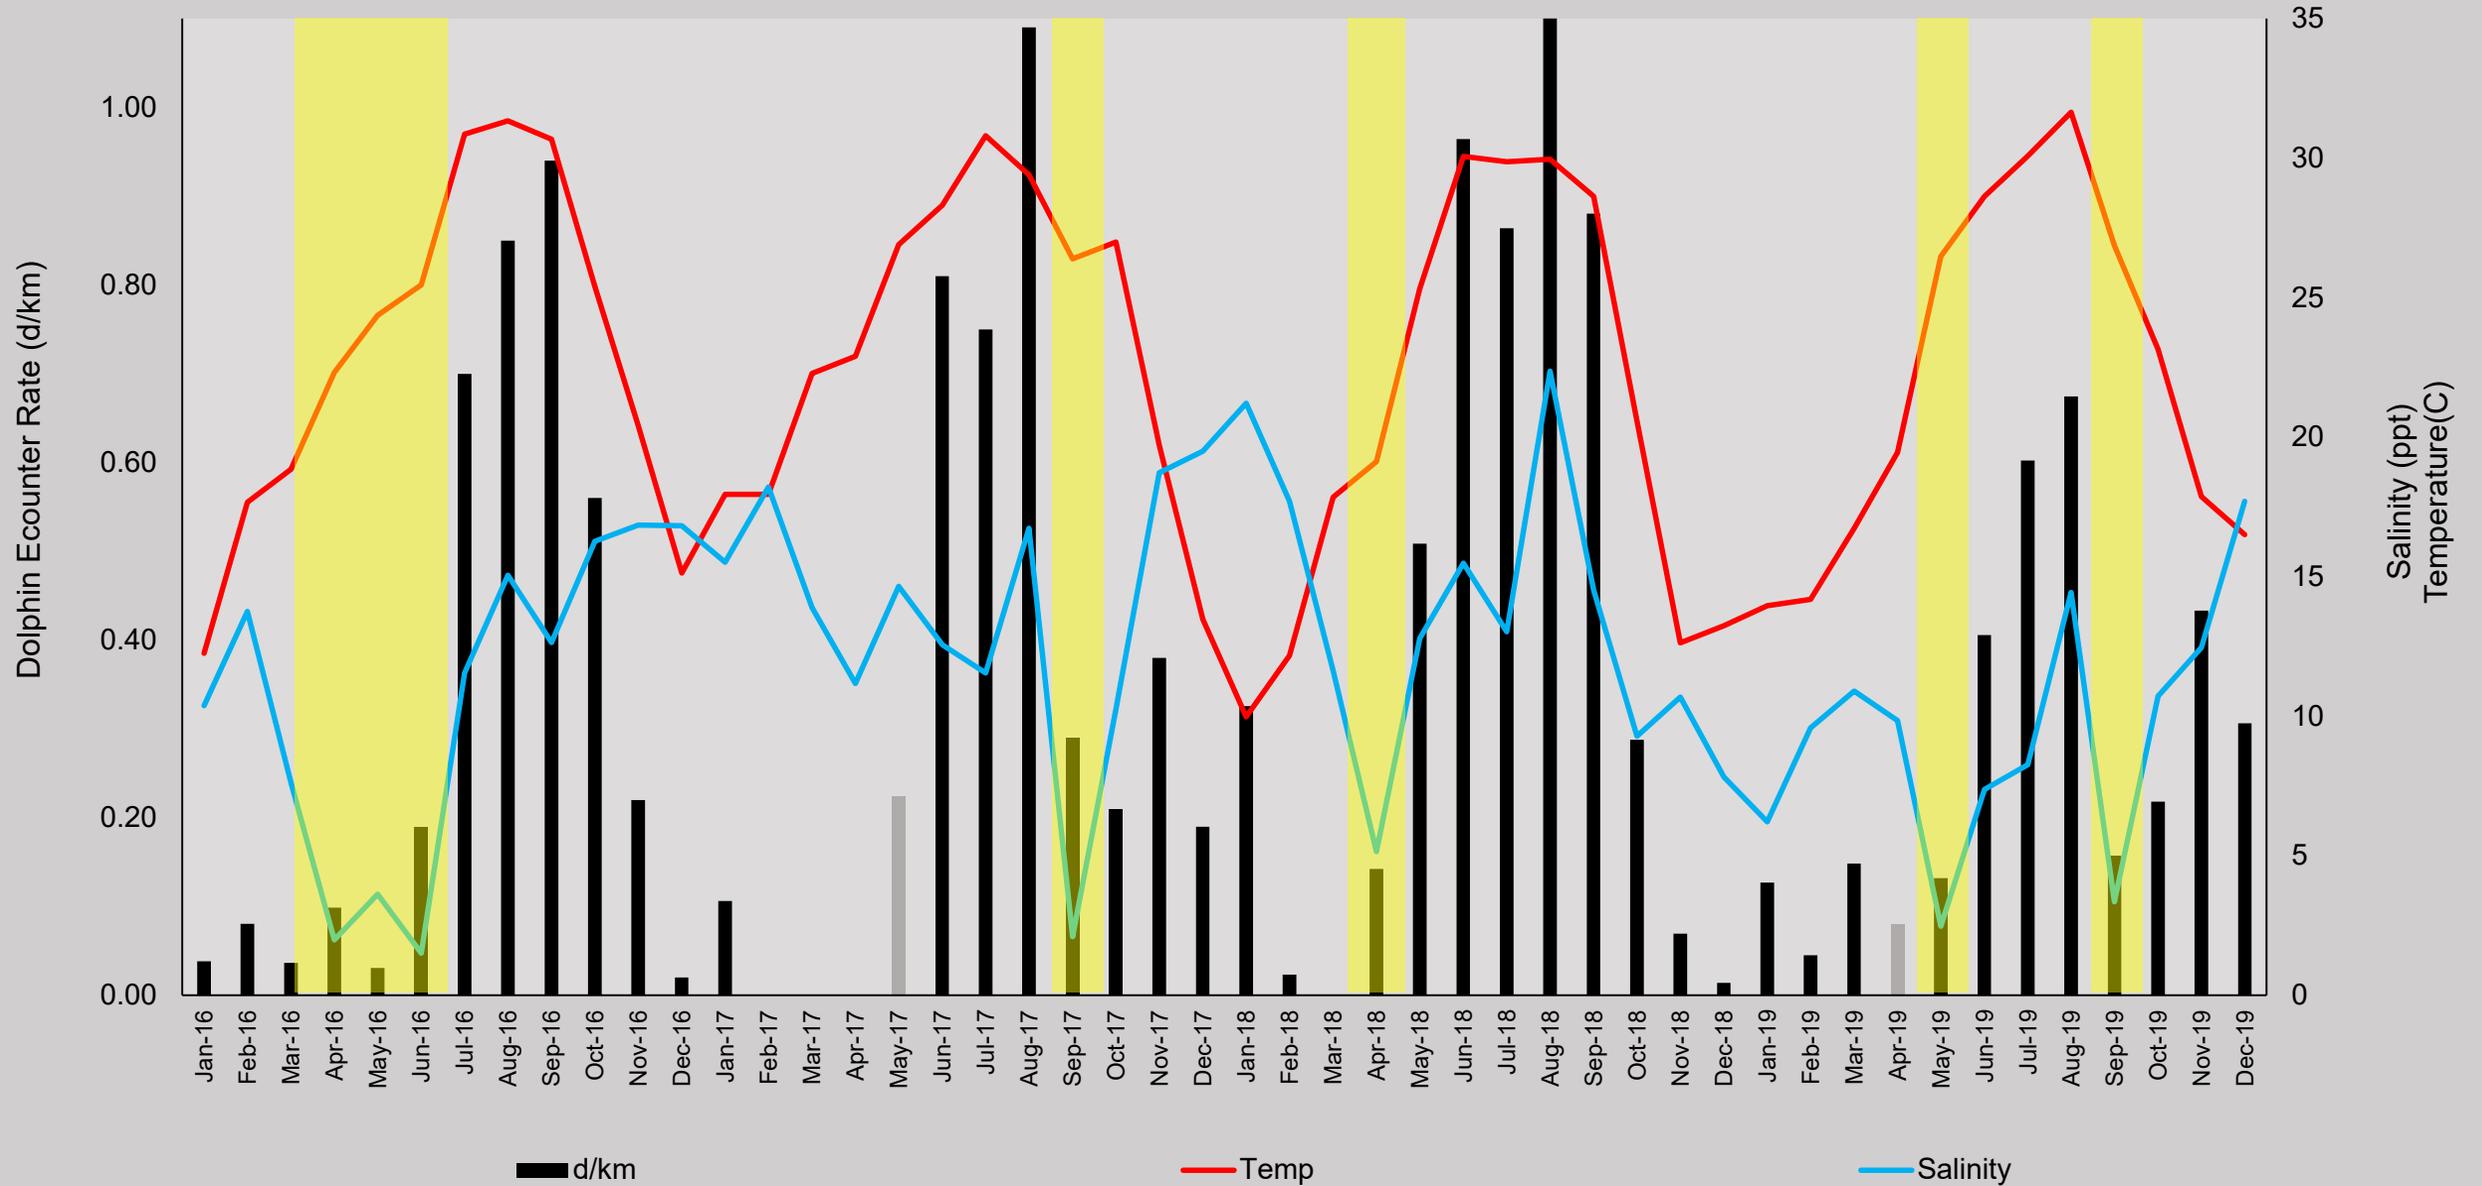

- 2016-2019 monthly surveys
- 105 survey days; 6655 km; 2388 dolphins in 355 groups
- Environmental Profiles

Results:

- Average 0.34 d/km
range 0.00 – 1.23
- Dolphins found year-round in UGB

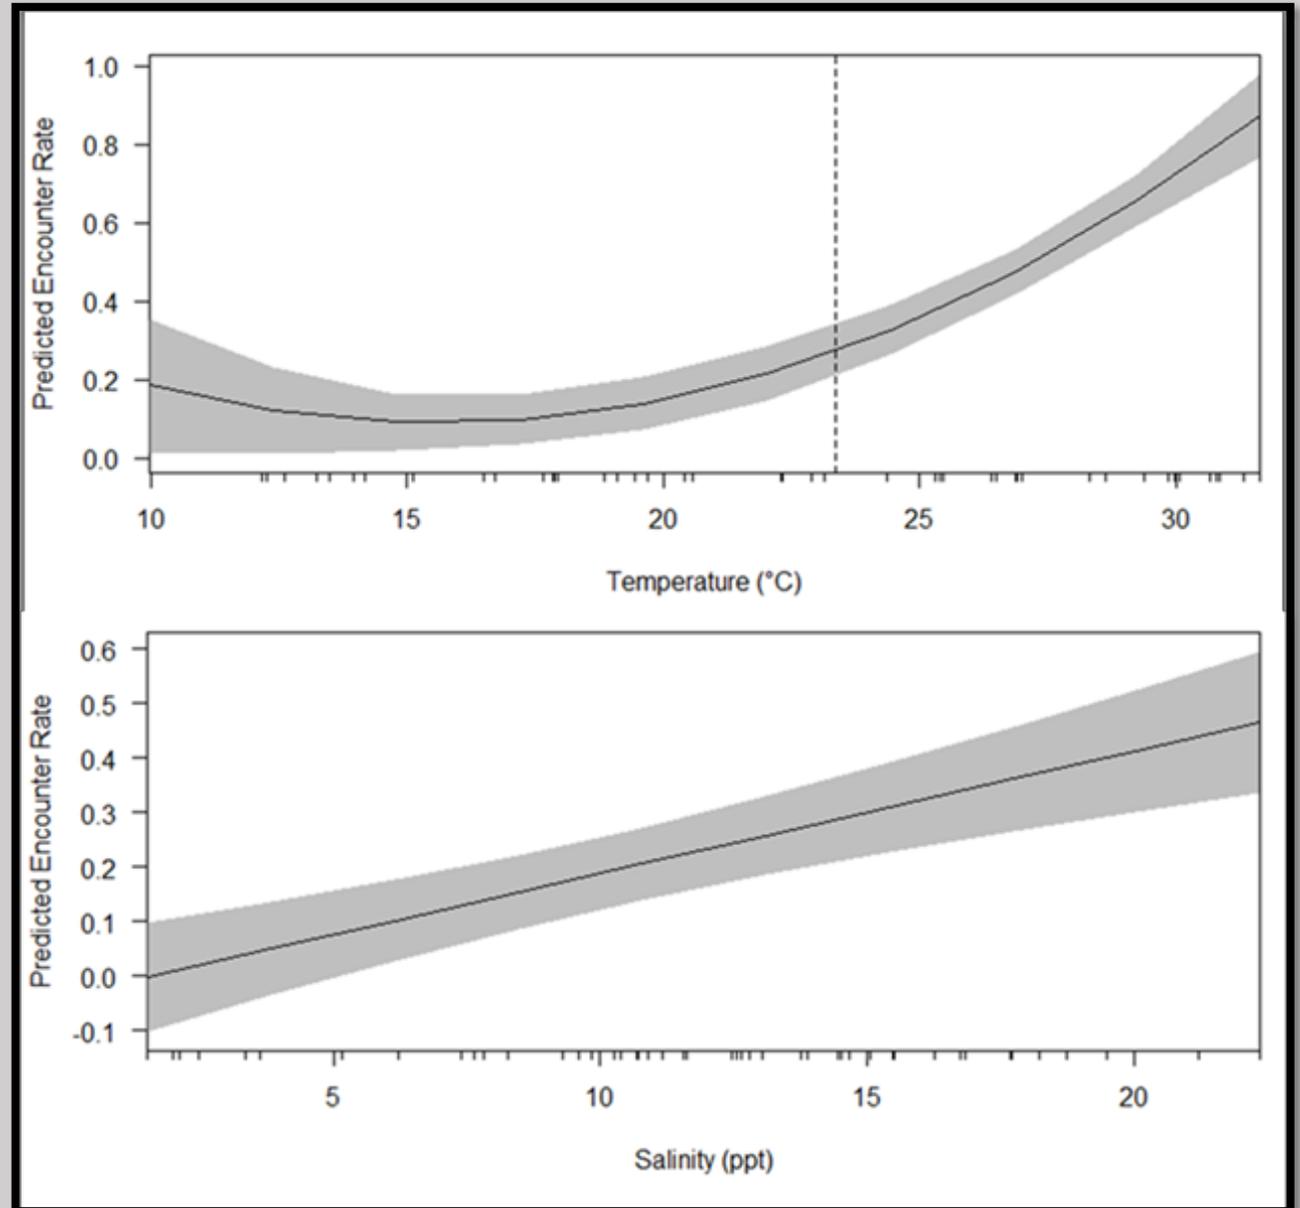

Encounter rates (dolphins/km) in Upper Galveston Bay from 2016-2019

Encounter Rates

Multiple Linear Regression

- 80% of variables explained by temperature and salinity
- Breaking point of 23°C when ERs increase
- Positive linear relationship with salinity
 - 0.02 d/km increase with 1.00ppt increase

Potential health consequences of low salinity exposure

“Freshwater Intoxication”

- Skin lesions = “hydropic degeneration” of the epidermis; may be accompanied by opportunistic fungal or algal growth
- Potential for:
 - Secondary infection
 - Electrolyte imbalance
 - Corneal edema
 - Increase disease and contaminant exposure risk
 - Mortality

NMFS Permit#18881

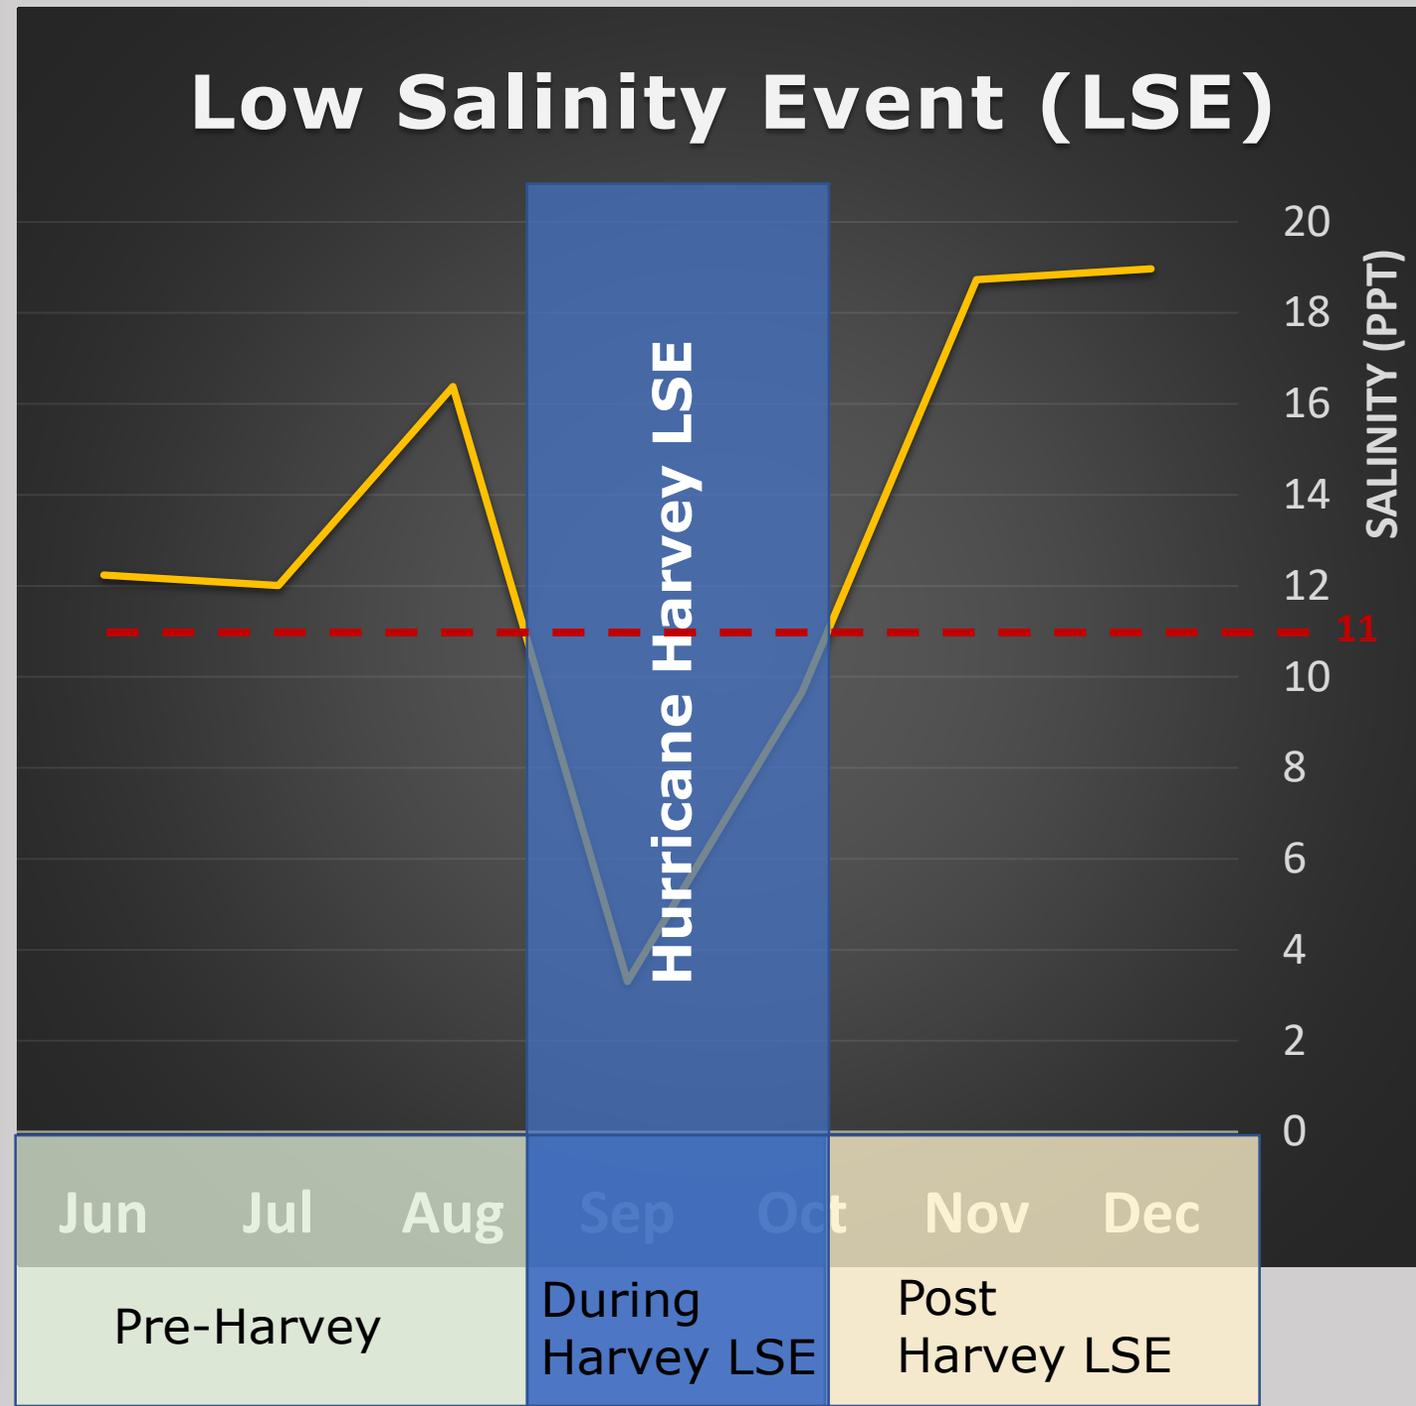

Hurricane Harvey Case Study

August 27th, 2017

Skin Lesions

Minimum Prevalence = proportion of identified individuals that exhibited visible lesions

Extent = percentage of each individual's epidermis covered by lesions

Low Extent <20%

Medium Extent 20-50%

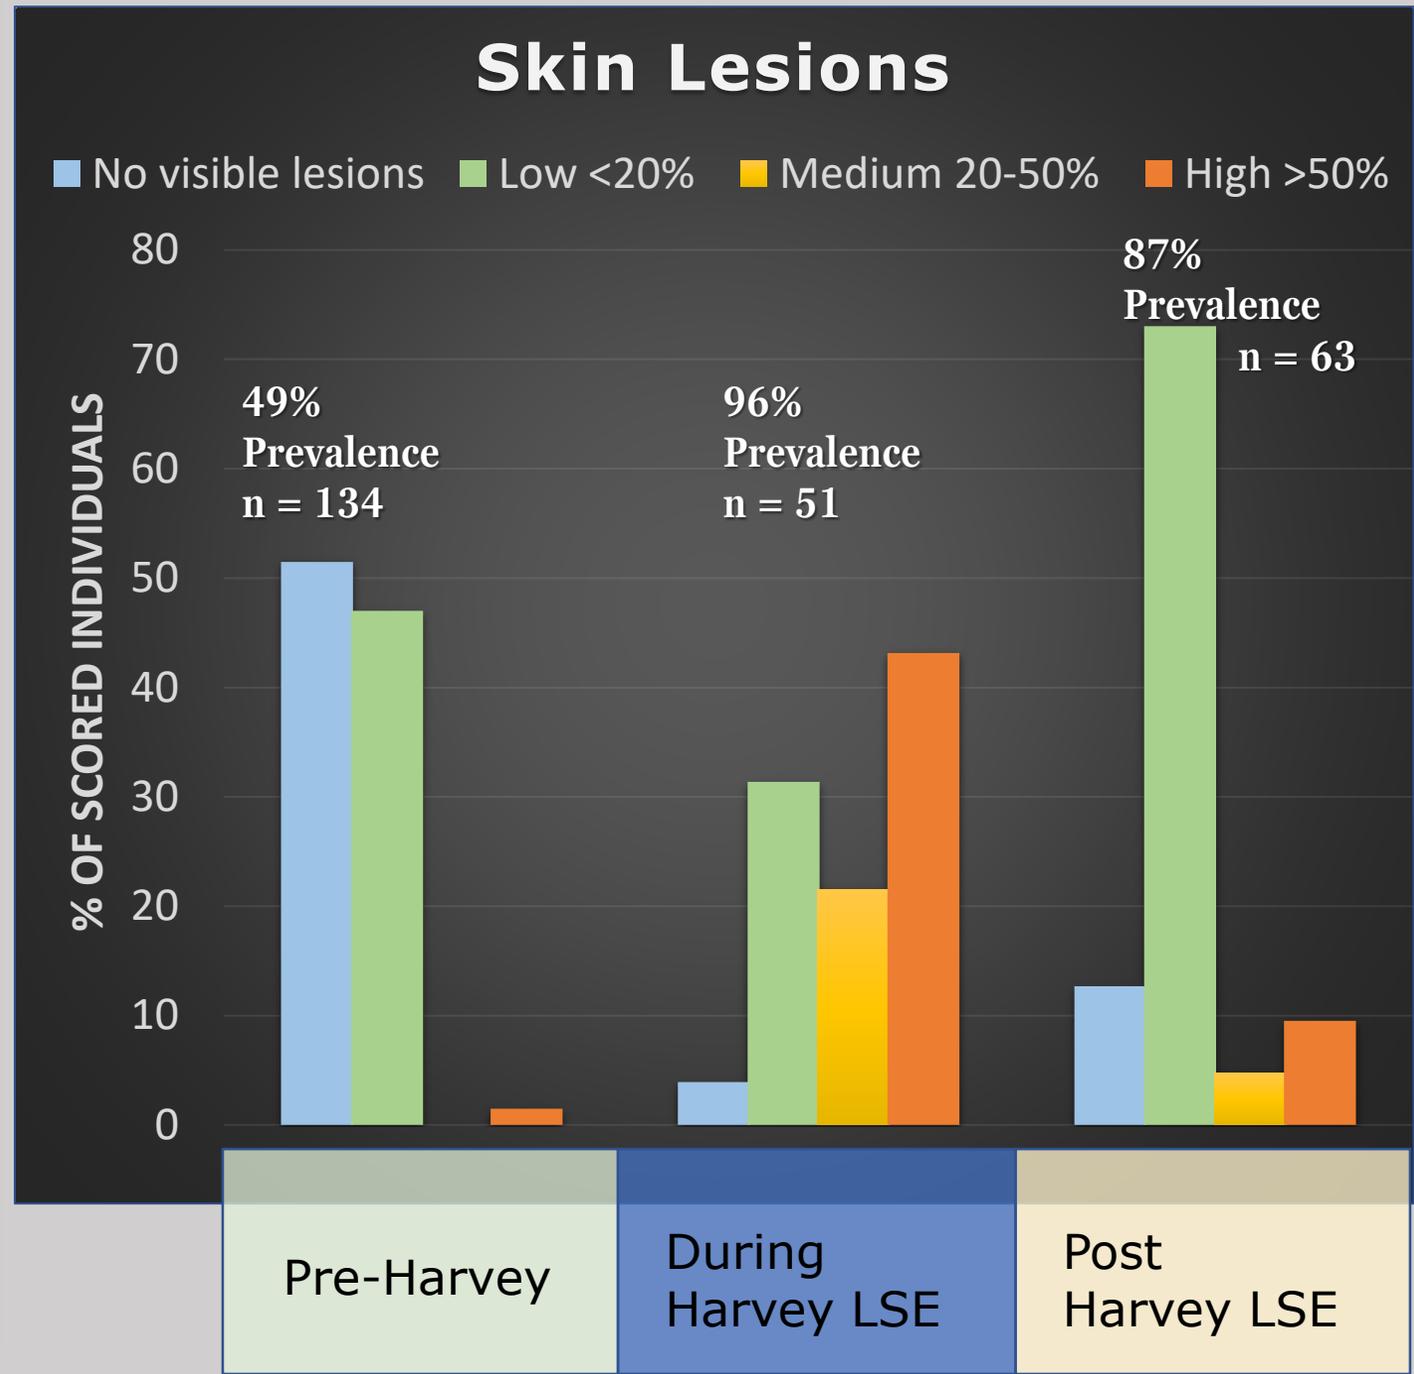

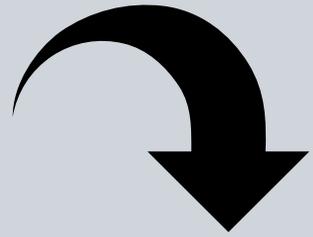

High Extent >50%

Skin Lesions

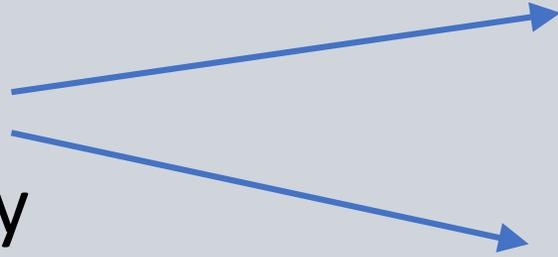

- Prevalence and extent of skin lesions increased from Pre-Harvey to During Harvey LSE (*p<0.05, n=20)
- Lesion extent decreased from During Harvey LSE to Post Harvey LSE (*p<0.05, n=21)
- Lesion prevalence was higher Post Harvey LSE compared to Pre-Harvey(*p<0.05, n=29), but lesion extent did not differ

*McNemar's test for paired comparisons

Low Salinity

Fewer Dolphins

Increased Skin Lesions

Future Questions

- Effects of repeated freshwater exposure on individual and population health
- Who in the population is the most vulnerable?
- Critical habitats? Salinity refuge?
- Potential effects of climate change and coastal infrastructure projects
